

Chapter 6, p. 197 Chemical Proportions in Compounds

## Practice Problems p. 201

1. % Ca:  $\frac{0.90 \text{ g Ca}}{2.50 \text{ g compound}} \times 100 = 36\%$

% Cl:  $\frac{1.60 \text{ g Cl}}{2.50 \text{ g compound}} \times 100 = 64.0\%$

(note that you are working with a compound containing Cl, so you use Cl, not Cl<sub>2</sub>. Cl<sub>2</sub> is a molecule of chlorine.)

2. The total mass of the compound is:  $7.22 + 2.53 + 5.25 = 15.00 \text{ g}$ .

% Ni:  $\frac{7.22 \text{ g}}{15.00 \text{ g}} \times 100 = 48.1\%$

% P:  $\frac{2.53 \text{ g}}{15.00 \text{ g}} \times 100 = 16.9\%$

% O:  $\frac{5.25}{15.00} \times 100 = 35.0\%$

(again, you are working with a compound containing oxygen, so you are working with O, not O<sub>2</sub> the molecule.)

3. Total mass: 650 mg

mass of H: 50.4 mg %H =  $\frac{50.4}{650} \times 100 = 7.75\%$

mass of C: 257 mg %C =  $\frac{257}{650} \times 100 = 39.5\%$

mass of O =  $650 - (50.4 + 257) = 342.6 \text{ mg}$  %O =  $\frac{342.6}{650} \times 100 = 52.7\%$

4. Total mass: 50.0 mg

mass of K: 13.3 mg %K =  $\frac{13.3}{50.0} \times 100 = 26.6\%$

mass of Cr: 17.7 mg %Cr =  $\frac{17.7}{50.0} \times 100 = 35.4\%$

mass of O =  $50.0 - (13.3 + 17.7) = 19.0 \text{ mg}$  %O =  $\frac{19.0}{50.0} \times 100 = 38.0\%$

## Practice Problems p. 204

5. For each of these % composition questions, you are comparing the number of molar masses (M) of N per molar mass (M) of the compound:

a) N<sub>2</sub>O  $\frac{2 \text{ M N}}{1 \text{ M N}_2\text{O}} \times 100 = \frac{2(14.01) \text{ g}}{44.02 \text{ g}} \times 100 = 63.65\%$

b) Sr(NO<sub>3</sub>)<sub>2</sub>  $\frac{2 \text{ M N}}{1 \text{ M Sr(NO}_3)_2} \times 100 = \frac{2(14.01) \text{ g}}{211.64 \text{ g}} \times 100 = 13.23\%$

c) NH<sub>4</sub>NO<sub>3</sub>  $\frac{2 \text{ M N}}{1 \text{ M NH}_4\text{NO}_3} \times 100 = \frac{2(14.01) \text{ g}}{80.06 \text{ g}} \times 100 = 35.00\%$

d) HNO<sub>3</sub>  $\frac{1 \text{ M N}}{1 \text{ M HNO}_3} \times 100 = \frac{1(14.01) \text{ g}}{63.02 \text{ g}} \times 100 = 22.23\%$

6. H<sub>2</sub>SO<sub>4</sub> % H:  $\frac{2 \text{ M H}}{1 \text{ M H}_2\text{SO}_4} \times 100 = \frac{2(1.01) \text{ g}}{98.09 \text{ g}} \times 100 = 2.06\%$

% S:  $\frac{1 \text{ M S}}{1 \text{ M H}_2\text{SO}_4} \times 100 = \frac{1(32.07) \text{ g}}{98.09 \text{ g}} \times 100 = 32.69\%$

$$\% \text{ O: } \frac{4 \text{ M O}}{1 \text{ M H}_2\text{SO}_4} \times 100 = \frac{4(16.00)\text{g}}{98.09 \text{ g}} \times 100 = 62.25\%$$

$$7. \text{ KNO}_3 \quad \% \text{ O: } \frac{3 \text{ M O}}{1 \text{ M KNO}_3} \times 100 = \frac{3(16.00) \text{ g}}{101.11 \text{ g}} \times 100 = 47.47\%$$

$$8. \text{ a) MnO}_2 \quad \% \text{ Mn: } \frac{1 \text{ M Mn}}{1 \text{ M MnO}_2} \times 100 = \frac{1(54.94) \text{ g}}{86.94 \text{ g}} \times 100 = 63.19 \%$$

$$\% \text{ O: } \frac{2 \text{ M O}}{1 \text{ M MnO}_2} \times 100 = \frac{2(16.00)\text{g}}{86.94 \text{ g}} \times 100 = 36.81\%$$

b) Since you know that MnO<sub>2</sub> is 63.19% Mn by mass, then in if you have 250 kg of MnO<sub>2</sub>, then you have 0.6319 x 250 kg = 158 kg of Mn.

### Section 6.2 p. 207 The Empirical Formula of a Compound

#### Practice Problems p. 209

In these questions, you go from mass of each element (from % mass) in a compound, to the moles of each element in the compound. Dividing by the smallest number of moles gives the simplest (reduced) mole ratio of each element in the compound, aka the empirical formula, EF.

9.

| Element | Mass (g)<br>(from mass percent) in<br>100 g sample | Molar Mass g/mol<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|--|-------------------------|--------------------------------------|---------------------------------------|
| H       | 17.6   | 1.01                    | $\frac{1.01}{17.6} = 0.0574$         | $\frac{0.0574}{0.0574} = 1$           |
| N       | 82.4   | 14.01                   | $\frac{14.01}{82.4} = 0.170$         | $\frac{0.170}{0.0574} = 2.96 = 3$     |

∴ EF = NH<sub>3</sub>

10.

| Element | Mass (g)<br>(from mass percent)<br>In 100 g sample | Molar Mass g/mol<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|--|-------------------------|--------------------------------------|---------------------------------------|
| Li      | 46.3   | 6.94                    | $\frac{46.3}{6.94} = 6.671$          | $\frac{6.671}{3.356} = 1.99 = 2$      |
| O       | 53.7   | 16.00                   | $\frac{53.7}{16.00} = 3.356$         | $\frac{3.356}{3.356} = 1$             |

∴ EF = Li<sub>2</sub>O

11.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|
| B       | 15.9                        | 10.81             | $\frac{15.9}{10.81} = 1.471$         | $\frac{1.471}{1.471} = 1$             |
| F       | 84.1                        | 19.00             | $\frac{84.1}{19.00} = 4.426$         | $\frac{4.426}{1.471} = 3.009 = 3$     |

∴ EF = BF<sub>3</sub>

12.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|
| Cl      | 52.51                       | 35.45             | $\frac{52.51}{35.45} = 1.481$        | $\frac{1.481}{1.481} = 1$             |
| S       | 47.78                       | 32.07             | $\frac{47.78}{32.07} = 1.490$        | $\frac{1.490}{1.481} = 1.006$         |

∴ EF = SCl

## Practice Problems p. 211

13.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) | Clearing Decimal<br>(multiply by 2) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|-------------------------------------|
| Cr      | 68.4                        | 52.00             | $\frac{68.4}{52.00} = 1.315$         | $\frac{1.315}{1.315} = 1$             | 1x2 = 2                             |
| O       | 31.6                        | 16.00             | $\frac{31.6}{16.00} = 1.975$         | $\frac{1.975}{1.315} = 1.50$          | 1.50 x 2 = 3.00                     |

∴ EF = Cr<sub>2</sub>O<sub>3</sub>

14.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) | Clearing Decimal<br>(multiply by 2) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|-------------------------------------|
| P       | 43.7                        | 30.97             | $\frac{43.7}{30.97} = 1.411$         | $\frac{1.411}{1.411} = 1$             | 1x2 = 2                             |
| O       | 56.4                        | 16.00             | $\frac{56.4}{16.00} = 3.525$         | $\frac{3.525}{1.411} = 2.498$         | 2.498 x 2 = 5.00                    |

∴ EF = P<sub>2</sub>O<sub>5</sub>

15.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) | Clearing Decimal<br>(multiply by 2) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|-------------------------------------|
| Na      | 17.6                        | 22.99             | $\frac{17.6}{22.99} = 0.766$         | $\frac{0.766}{0.763} = 1.00$          | 1.00 x 2 = 2.00                     |
| Cr      | 39.7                        | 52.00             | $\frac{39.7}{52.00} = 0.763$         | $\frac{0.763}{0.763} = 1$             | 1 x 2 = 2                           |
| O       | 42.8                        | 16.00             | $\frac{42.8}{16.00} = 2.675$         | $\frac{2.675}{0.763} = 3.50$          | 3.5 x 2 = 7                         |

∴ EF = NaCr<sub>2</sub>O<sub>7</sub>

16.

| Element | Mass<br>(from mass percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) | Clearing Decimal<br>(multiply by 3) |
|---------|-----------------------------|-------------------|--------------------------------------|---------------------------------------|-------------------------------------|
| C       | 69.9                        | 12.01             | $\frac{69.9}{12.01} = 5.820$         | $\frac{5.820}{1.456} = 3.997$         | 3.997 x 3 = 12.00                   |

|   |      |       |                              |                               |                          |
|---|------|-------|------------------------------|-------------------------------|--------------------------|
| H | 6.86 | 1.01  | $\frac{6.86}{1.01} = 6.792$  | $\frac{6.792}{1.456} = 4.665$ | $4.665 \times 3 = 14.00$ |
| O | 23.3 | 16.00 | $\frac{23.3}{16.00} = 1.456$ | $\frac{1.456}{1.456} = 1$     | $1 \times 3 = 3$         |

$\therefore$  EF = C<sub>12</sub>H<sub>14</sub>O<sub>3</sub>

### Section Review p. 214

1) a) An empirical formula of a compound is also called its simplest formula because the ratios of its constituent atoms are reduced to their smallest numbers.

b) The actual molecular formula of a compound will be a whole number multiple (including 1) of the empirical formula. It is therefore possible that an empirical formula is also the molecule's molecular formula.

2.

| Element | Mass (%) in 100 g sample | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|--------------------------|----------|--------|------------|-----------------------------|
| C       | 63.1                     | 12.01    | 5.25   | 2.6        | 8                           |
| H       | 5.31                     | 1.01     | 5.25   | 2.6        | 8                           |
| O       | 31.6                     | 16.00    | 2.00   | 1          | 3                           |

$\therefore$  empirical formula of methyl salicylate is C<sub>8</sub>H<sub>8</sub>O<sub>3</sub>.

3. a)

| Element | Mass (%) in 100 g sample | M (g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|--------------------------|-----------|--------|------------|-----------------------------|
| Cl      | n/a                      | n/a       | 0.315  | 1          | 2                           |
| O       | n/a                      | n/a       | 1.1    | 3.5        | 7                           |

$\therefore$  EF is Cl<sub>2</sub>O<sub>7</sub>.

b)

| Element | Mass (g) in 100 g sample | M (g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|--------------------------|-----------|--------|------------|-----------------------------|
| Si      | 4.90                     | 28.09     | 0.17   | 1          | 1                           |
| Cl      | 24.8                     | 35.45     | 0.70   | 4          | 4                           |

$\therefore$  EF is SiCl<sub>4</sub>

4.

| Element | Mass (g) in 100 g sample (from %) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|-----------------------------------|----------|--------|------------|-----------------------------|
| C       | 40.0                              | 12.01    | 3.33   | 1          | 1                           |

|   |      |       |      |   |   |
|---|------|-------|------|---|---|
| H | 6.71 | 1.01  | 6.64 | 2 | 2 |
| O | 53.3 | 16.00 | 3.33 | 1 | 1 |

∴ EF is CH<sub>2</sub>O for lactic acid.

5. The empirical formula is not the definitive formula of the compound found in my client's possession. It is only the actual formula reduced to its simplest ratio. It does not positively identify the substance in my client's possession. As an example, two very different compounds, one a gas called acetylene with an actual formula of C<sub>2</sub>H<sub>2</sub>, and benzene, a liquid with an actual formula of C<sub>6</sub>H<sub>6</sub>, both have the same empirical formula of CH. Neither one is positively identified by the empirical formula. The only thing that an empirical formula can prove in a court of law what a formula of a compound is NOT, or what it COULD be.

6.

| Element | Mass (g) in 100 g (from %) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------------------------|----------|--------|------------|-----------------------------|
| C       | 76.54                      | 12.01    | 6.37   | 9          | 9                           |
| H       | 12.13                      | 1.01     | 12.01  | 17         | 17                          |
| O       | 11.33                      | 16.00    | 0.71   | 1          | 1                           |

∴ EF is C<sub>9</sub>H<sub>17</sub>O

7.

| Element | Mass (g) in 100 g sample (from %) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|-----------------------------------|----------|--------|------------|-----------------------------|
| C       | 74.13                             | 12.01    | 6.17   | 5.5        | 11                          |
| H       | 7.92                              | 1.01     | 7.84   | 7          | 14                          |
| O       | 17.95                             | 16.00    | 1.12   | 1          | 2                           |

∴ EF of phenyl valerate is C<sub>11</sub>H<sub>14</sub>O<sub>2</sub>

8. a)

| Element | Mass (g) in 100 g sample (from %) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|-----------------------------------|----------|--------|------------|-----------------------------|
| C       | 64.56                             | 12.01    | 5.38   | 10         | 10                          |
| H       | 5.42                              | 1.01     | 5.36   | 10         | 10                          |
| Fe      | 30.03                             | 55.85    | 0.54   | 1          | 1                           |

∴ EF of ferrocene is  $C_{10}H_{10}Fe$

b) Yes it does. The description says that each molecule of ferrocene contains exactly one atom of Fe. Since the empirical formula has one Fe in it, then the molecular formula of ferrocene is the same as its empirical formula. In addition, if the two rings that 'sandwich' the Fe atom are both the same, then each ring has a formula of  $C_5H_5$ .

### Section 6.3, p. 215 The Molecular Formula of a Compound

#### Practice Problems p. 218

The molecular formula is a whole number multiple (x1, x2, x3... etc) of the empirical formula. The ratio of the molecular formula to the empirical formula is the same as the ratio of the molecular formula mass to the empirical formula mass.

17. Given: E.F. =  $C_2H_5$ . ∴ E.F. mass =  $2C + 5H = 2(12.01) + 5(1.01) = 29.07$

Given: M.F. mass = 58 g/mol

$$\frac{M.F.}{E.F.} = \frac{M.F. \text{ mass}}{E.F. \text{ mass}}$$

$$\therefore M.F. = E.F. \times \frac{M.F. \text{ mass}}{E.F. \text{ mass}} = C_2H_5 \times \frac{58}{29.07} = C_2H_5 \times 2 = C_4H_{10}$$

18. Given: E.F. =  $CHO_2$ . ∴ E.F. mass =  $C + H + 2O = (12.01) + (1.01) + 2(16.00) = 45.02$

Given: M.F. mass = 90 g/mol

$$\frac{M.F.}{E.F.} = \frac{M.F. \text{ mass}}{E.F. \text{ mass}}$$

$$\therefore M.F. = E.F. \times \frac{M.F. \text{ mass}}{E.F. \text{ mass}} = CHO_2 \times \frac{90}{45.02} = CHO_2 \times 2 = C_2H_2O_4$$

19. Given: E.F. =  $C_{18}H_{21}NO_3$ . ∴ E.F. mass =  $18C + 21H + 1N + 3O$

$$= 18(12.01) + 21(1.01) + 1(14.01) + 3(16.00) = 299.40$$

Given: M.F. mass = 299 g/mol

$$\frac{M.F.}{E.F.} = \frac{M.F. \text{ mass}}{E.F. \text{ mass}}$$

$$\therefore M.F. = E.F. \times \frac{M.F. \text{ mass}}{E.F. \text{ mass}} = C_{18}H_{21}NO_3 \times \frac{299}{299.4} = C_{18}H_{21}NO_3 \times 1 = C_{18}H_{21}NO_3$$

20.

| Element | Mass<br>(from mass<br>percent) | Molar Mass<br>(M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|--------------------------------|-------------------|--------------------------------------|---------------------------------------|
| C       | 75.0                           | 12.01             | $\frac{75.0}{12.01} = 6.245$         | $\frac{6.245}{1.25} = 5$              |
| H       | 5.05                           | 1.01              | $\frac{5.05}{1.01} = 5.00$           | $\frac{5.00}{1.25} = 4$               |
| O       | 20.0                           | 16.00             | $\frac{20.0}{16.00} = 1.25$          | $\frac{1.25}{1.25} = 1$               |

∴ EF =  $C_5H_4O$

∴ E.F. mass =  $5C + 4H + O = 5(12.01) + 4(1.01) + (16.00) = 80.09$

Given: M.F. mass = 240.28 g/mol

$$\frac{M.F.}{E.F.} = \frac{M.F. \text{ mass}}{E.F. \text{ mass}}$$

$$\therefore M.F. = E.F. \times \frac{M.F. \text{ mass}}{E.F. \text{ mass}} = C_5H_4O \times \frac{240.28}{80.09} = C_5H_4O \times 3 = C_{15}H_{12}O_3$$

#### Section Review p. 218

1. A mass spectrometer will give you the mass of a molecule of compound in number of protons and neutrons, which is the same as its molar mass. This number, along with the molar mass of the empirical formula, can be used to determine the molecular formula of the compound.

$$2. n(\text{O atoms}) = \frac{3.61 \times 10^{24} \text{ atoms O}}{1 \text{ mol tartaric acid}} \times \frac{1 \text{ mol O}}{6.02 \times 10^{23} \text{ atoms O}} = \frac{6 \text{ mol O}}{1 \text{ mol tartaric acid}}$$

Since the empirical formula of  $\text{C}_2\text{H}_3\text{O}_3$  has 3 mol of O, the molecular formula of tartaric acid must be  $2(\text{C}_2\text{H}_3\text{O}_3) = \text{C}_4\text{H}_6\text{O}_6$

3. A molecular formula identifies exactly how many atoms of each element are in a molecule of a particular substance, providing a unique identification. An empirical formula only give the ratios of the atoms in the molecule in their simplest form. The actual formula is a whole number formula of this. Therefore, an empirical formula simply gives a guide to a 'list' of possible structures without identifying any specific one as the molecule in question.

4. a) Empirical formula is  $0.5(\text{C}_4\text{H}_6\text{O}_2) = \text{C}_2\text{H}_3\text{O}$

b) The molar mass of the molecular formula of vinyl acetate is twice that for its empirical formula, since the first formula is twice that of the second.

5. Molecular Formula  $\text{C}_{6x}\text{H}_{5x}\text{O}_x$ , where x is a whole number multiple

Empirical formula =  $\text{C}_6\text{H}_5\text{O}$

$M(\text{C}_6\text{H}_5\text{O}) = 93.11 \text{ g/mol}$

Ratio of molar masses =  $186 \text{ g/mol} \div 93.11 \text{ g/mol} = 2$

Therefore, molecular formula =  $2(\text{C}_6\text{H}_5\text{O}) = \text{C}_{12}\text{H}_{10}\text{O}_2$

#### Section 6.4, p. 219 Finding Empirical and Molecular Formulas by Experiment

##### Practice Problems p. 221

These questions are on combustion analysis.

21. Given: 0.539 g sample of a hydrocarbon (i.e. the sample contains only H and C) produces 1.64 g  $\text{CO}_2$  and 0.807 g  $\text{H}_2\text{O}$ :

All the grams of C in the 1.64 g of  $\text{CO}_2$  came from the  $\text{C}_7\text{H}_?$  sample, and all the grams of H in the 0.807 g  $\text{H}_2\text{O}$  came from the H in the  $\text{C}_7\text{H}_?$  sample.

- To solve this problem you will first determine the grams C and the grams H from the sample.

- Then you will use those masses, to solve the empirical formula of  $\text{C}_7\text{H}_?$ .

Step 1: Find the mass of C and H in the sample of  $\text{C}_7\text{H}_?$

The mass of C in 1.64 g  $\text{CO}_2$ :

$$1.64 \text{ g CO}_2 \times \frac{1 \text{ M C}}{1 \text{ M CO}_2} = 1.64 \text{ g CO}_2 \times \frac{1(12.01)\text{C}}{1(44.01)\text{g CO}_2} = 0.448 \text{ g C (mass of carbon before reaction)}$$

The mass of H in 0.807 g  $\text{H}_2\text{O}$ :

$$0.807 \text{ g H}_2\text{O} \times \frac{2 \text{ M H}}{1 \text{ M H}_2\text{O}} = 0.807 \text{ g H}_2\text{O} \times \frac{2(1.01)\text{g H}}{1(18.02) \text{ g H}_2\text{O}} = 0.0905 \text{ g H}$$

$\therefore$  0.448 g C and 0.0905 g H came from the sample of  $\text{C}_7\text{H}_?$ .

Step 2: Use the masses of C and H to solve for the empirical formula of  $\text{C}_7\text{H}_?$

| Element | Mass  | Molar Mass (M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) | Clearing the Decimal<br>X 5 |
|---------|-------|----------------|--------------------------------------|---------------------------------------|-----------------------------|
| C       | 0.448 | 12.01          | $\frac{0.448}{12.01} = 0.0373$       | $\frac{0.0373}{0.0373} = 1$           | $1 \times 5 = 5$            |

|   |        |      |                                |                               |                     |
|---|--------|------|--------------------------------|-------------------------------|---------------------|
| H | 0.0905 | 1.01 | $\frac{0.0905}{1.01} = 0.0896$ | $\frac{0.0896}{0.0373} = 2.4$ | $2.4 \times 5 = 12$ |
|---|--------|------|--------------------------------|-------------------------------|---------------------|

$\therefore$  EF = C<sub>5</sub>H<sub>12</sub>

This question also asked for the % composition of the sample.

Given: 0.539 g sample, containing 0.488 g C and 0.0905 g H:

$$\% \text{ C: } \frac{0.448 \text{ g C}}{0.539 \text{ g sample}} \times 100 = 83.1\%$$

$$\% \text{ H: } \frac{0.0905 \text{ g H}}{0.539 \text{ g sample}} \times 100 = 16.8 \%$$

%C + %H = 83.1 + 16.8 = 99.9% which is close enough to 100.

22. This problem is trickier in that you have to solve for the mass of oxygen in the sample as well, then solve for the empirical formula and then also solve for the molecular formula:

Step 1: Find the mass of C and H in the sample of C<sub>7</sub>H<sub>7</sub>

The mass of C in 2.23 g CO<sub>2</sub>:

$$2.23 \text{ g CO}_2 \times \frac{1 \text{ M C}}{1 \text{ M CO}_2} = 2.23 \text{ g CO}_2 \times \frac{1(12.01)\text{C}}{1(44.01)\text{g CO}_2} = 0.609 \text{ g C}$$

The mass of H in 0.807 g H<sub>2</sub>O:

$$0.652 \text{ g H}_2\text{O} \times \frac{2 \text{ M H}}{1 \text{ M H}_2\text{O}} = 0.652 \text{ g H}_2\text{O} \times \frac{2(1.01)\text{g H}}{1(18.02) \text{ g H}_2\text{O}} = 0.0731 \text{ g H}$$

$\therefore$  0.609 g C and 0.0731 g H came from the sample of C<sub>7</sub>H<sub>7</sub>O<sub>7</sub>

The oxygen in the CO<sub>2</sub> and the H<sub>2</sub>O came from both the C<sub>7</sub>H<sub>7</sub>O<sub>7</sub> and the O<sub>2</sub>. The way to find out how much came from just the C<sub>7</sub>H<sub>7</sub>O<sub>7</sub> is:

$$0.874 \text{ g C}_7\text{H}_7\text{O}_7 = 0.609 \text{ g C} + 0.0731 \text{ g H} + \text{X g O}$$

$$\text{X g O} = 0.874 \text{ g C}_7\text{H}_7\text{O}_7 - (0.609 \text{ g C} + 0.0731 \text{ g H}) = 0.192 \text{ g O}$$

$\therefore$  0.609 g C and 0.0731 g H and 0.192 g O came from the sample of C<sub>7</sub>H<sub>7</sub>O<sub>7</sub>

Step 2: Use the masses of C, H and O to solve for the empirical formula of C<sub>7</sub>H<sub>7</sub>

| Element | Mass   | Molar Mass (M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(+ smallest n) | Clearing the Decimal<br>X 5 |
|---------|--------|----------------|--------------------------------------|---------------------------------------|-----------------------------|
| C       | 0.609  | 12.01          | $\frac{0.609}{12.01} = 0.05071$      | $\frac{0.05071}{0.0120} = 4.22$       | $4.22 \times 5 = 21$        |
| H       | 0.0731 | 1.01           | $\frac{0.0731}{1.01} = 0.07238$      | $\frac{0.07238}{0.0120} = 6.03$       | $6.03 \times 5 = 30$        |
| O       | 0.192  | 16.00          | $\frac{0.192}{16.00} = 0.0120$       | $\frac{0.0120}{0.0120} = 1$           | $1 \times 5 = 5$            |

$\therefore$  EF = C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>

Step 3: Finding the molecular formula. Given: molecular mass = 362 g/mol

$$\therefore \text{E.F. mass} = 21\text{C} + 30\text{H} + 5\text{O} = 21(12.01) + 30(1.01) + 5(16.00) = 362.5 \text{ g}$$

The empirical formula mass and the molecular formula mass are the same.

$\therefore$  the E.F. = the M.F.                      The molecular formula is C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>

## Practice Problems p. 225

These are hydrate problems.

23. Given: the formula,  $\text{MgSO}_3 \cdot 6\text{H}_2\text{O}$  and asked for the % by mass water.

This is just a % by mass problem, only you are using a component molecule ( $\text{H}_2\text{O}$ ), rather than a component element.

$$\% \text{ mass} = \frac{6 \text{ M H}_2\text{O}}{1 \text{ M MgSO}_3 \cdot 6\text{H}_2\text{O}} \times 100$$

Note, it's the %  $\text{H}_2\text{O}$  in the entire hydrate, so you use the entire formula for the hydrate.

$$= \frac{6(18.02)}{1(212.50)} \times 100 = 50.88\%$$

24. Given: a 3.34 g sample of  $\text{SrS}_2\text{O}_3 \cdot \text{XH}_2\text{O}$ . The mass of the anhydrous salt,  $\text{SrS}_2\text{O}_3$ , is 2.30 g. Find X.

The mass of the water in the sample is:  $3.34 \text{ g} - 2.30 \text{ g} = 1.04 \text{ g}$

This now becomes an empirical formula problem, but you are working with component molecules (the anhydrous salt and the water), rather than component elements.

| Component Molecule       | Mass | Molar Mass (M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|--------------------------|------|----------------|--------------------------------------|---------------------------------------|
| $\text{H}_2\text{O}$     | 1.04 | 18.02          | $\frac{1.04}{18.02} = 0.05771$       | $\frac{0.05771}{0.01151} = 5$         |
| $\text{SrS}_2\text{O}_3$ | 2.30 | 199.76         | $\frac{2.30}{199.76} = 0.01151$      | $\frac{0.01151}{0.01151} = 1$         |

∴ The formula of the hydrate is  $\text{SrS}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$  (the value of X is 5).

25. Given the formula  $\text{Zn}(\text{ClO}_3)_2 \cdot \text{XH}_2\text{O}$ , with Zn 21.5% by mass

In order to find X, you need the mass of the anhydrous salt,  $\text{Zn}(\text{ClO}_3)_2$ , and the mass of the  $\text{H}_2\text{O}$ .

Since the hydrate is 21.5% by mass Zn, then in a 100 g sample of the hydrate, there would be 21.5 g Zn. With the mass of the Zn, you can solve for the mass of the  $\text{ClO}_3$ .

In the formula for the hydrate, the molar ratio of  $\text{ClO}_3$  to Zn, is:  $\frac{2 \text{ mol ClO}_3}{1 \text{ mol Zn}}$

mole ratio in a compound has to be the same ratio as molar mass ratio in the compound:

$$\therefore \frac{2 \text{ mol ClO}_3}{1 \text{ mol Zn}} = \frac{2 \text{ M ClO}_3}{1 \text{ M Zn}}$$

Now you can solve for the mass of  $\text{ClO}_3$  in 100 g of the hydrate:

$$21.5 \text{ g Zn} \times \frac{2 \text{ M ClO}_3}{1 \text{ M Zn}} = 21.5 \text{ g Zn} \times \frac{2(83.45) \text{ g ClO}_3}{1(65.39) \text{ Zn}} = 54.88 \text{ g ClO}_3.$$

So in a 100 g sample of the hydrate, you have 21.5 g Zn and 54.88 g  $\text{ClO}_3$ . That means you have:

$$21.5 + 54.88 = 76.38 \text{ g of the anhydrous salt } \text{Zn}(\text{ClO}_3)_2.$$

And in the 100 g sample, you have  $100 - 76.38 = 23.62 \text{ g H}_2\text{O}$ . Now that you have the mass of the salt and the water, you can solve for X:

| Component Molecule          | Mass<br>(% in 100 g sample) | Molar Mass (M) | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|-----------------------------|-----------------------------|----------------|--------------------------------------|---------------------------------------|
| $\text{H}_2\text{O}$        | 23.62                       | 18.02          | $\frac{23.62}{18.02} = 1.3108$       | $\frac{1.3108}{0.3288} = 4$           |
| $\text{Zn}(\text{ClO}_3)_2$ | 76.38                       | 232.29         | $\frac{76.38}{232.29} = 0.3288$      | $\frac{0.3288}{0.3288} = 1$           |

∴ The formula of the hydrate is  $\text{Zn}(\text{ClO}_3)_2 \cdot 4\text{H}_2\text{O}$  (the value of X is 4).

### Section Review p. 228

2.  $M(\text{MgSO}_4 \cdot 7\text{H}_2\text{O}) = (24.31 + 32.07 + 16.00 \times 4 + 7(16.00 + 2 \times 1.01)) = 246.52 \text{ g/mol}$   
 $M(\text{MgSO}_4) = 120.38 \text{ g/mol}$

$$\text{Calculating the mass of Magnesium} = 1000 \text{ g Bag} \times \frac{24.31 \text{ g Mg}}{246.52 \text{ g MgSO}_4 \cdot 7\text{H}_2\text{O}} = 98.62 \text{ g Mg in MgSO}_4 \cdot 7\text{H}_2\text{O}$$

$$\text{Mass of Mg in MgSO}_4 \cdot 7\text{H}_2\text{O} = \text{Mg in MgSO}_4 \cdot 7\text{H}_2\text{O} = 98.62 \text{ g}$$

$$\text{Mass of MgSO}_4 = \frac{120.38 \text{ g MgSO}_4}{24.31 \text{ g Mg}} \times 98.62 \text{ g Mg} = 488 \text{ g MgSO}_4$$

or alternative solution:

$$\text{Calculating the \# moles in 1 kg sample of MgSO}_4 \cdot 7\text{H}_2\text{O}: n = 1000 \text{ g} \times \frac{1 \text{ mol}}{246.52 \text{ g}} = 4.056 \text{ mol MgSO}_4 \cdot 7\text{H}_2\text{O}$$

$$n(\text{moles}) \text{ of Mg in MgSO}_4 = n \text{ of (MgSO}_4 \cdot 7\text{H}_2\text{O}) = 4.056 \text{ mol}$$

$$\text{Mass of magnesium: } m(\text{Mg}) = 4.056 \text{ mol} \times \frac{24.31 \text{ g Mg}}{1 \text{ mol Mg}} = 98.601 \text{ g Mg}$$

$$\text{Mass of magnesium sulphate: } m(\text{MgSO}_4) = 98.601 \text{ g Mg} \times \frac{120.38 \text{ g MgSO}_4}{24.31 \text{ g Mg}} = 488 \text{ g MgSO}_4$$

6.  $\text{Zn}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  Molar Mass of anhydrous  $\text{M}(\text{Zn}(\text{NO}_3)_2)$ :  $65.39 \text{ g} + 14.01 \times 2 + 16.00 \times 6 = 189.41 \text{ g/mol}$   
 ∴ 1 mol of sample of  $\text{Zn}(\text{NO}_3)_2$  has 189.41 g of anhydrous zinc nitrate  
 In 63.67g sample of anhydrous  $\text{Zn}(\text{NO}_3)_2$ , there would be 100 g of hydrate  
 ∴ mass of water ( $\text{H}_2\text{O}$ ) =  $100\text{g} - 63.67 \text{ g} = 36.33 \text{ g}$

$$\text{Number of moles of anhydrous Zn(NO}_3)_2: n = 63.67 \text{ g} \times \frac{1 \text{ mol}}{189.41 \text{ g}} = 0.3361 \text{ mol}$$

$$\text{Number of moles of water H}_2\text{O}: n = 36.33 \text{ g} \times \frac{1 \text{ mol}}{18.02 \text{ g}} = 2.016 \text{ mol}$$

| Compound                   | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n)           | Clearing the Decimal |
|----------------------------|--------------------------------------|---|----------------------|
| $\text{Zn}(\text{NO}_3)_2$ | 0.3361 mol                           | $\frac{0.3361 \text{ mol}}{0.3361 \text{ mol}}$ | 1                    |
| $\text{H}_2\text{O}$       | 2.016 mol                            | $\frac{2.016 \text{ mol}}{0.3361 \text{ mol}}$  | 6                    |

∴  $x=6$  since the ratio of 1 formula unit of  $\text{Zn}(\text{NO}_3)_2$  for every 6 molecules of water.

7. 2.524 g sample of carbon, hydrogen, oxygen

a) Mass of carbon (since all the carbon in the sample is converted into  $\text{CO}_2$ ) =  $3.703 \text{ g CO}_2 \times \frac{12.01 \text{ g C}}{44.01 \text{ g CO}_2} = 1.0105 \text{ g C in sample}$

Mass of hydrogen in sample (since all the hydrogen in sample is converted into H<sub>2</sub>O =  $1.514 \text{ g H}_2\text{O} \times \frac{2.02 \text{ g H}}{18.02 \text{ g H}_2\text{O}} = 0.1697 \text{ g H}_2$  in sample

Mass of oxygen in sample =  $2.524 \text{ g} - 1.0105 \text{ g} - 0.1697 \text{ g} = 1.3438 \text{ g O}$

| Element | Mass (g) | Molar Mass (M) g/mol | Number of Moles<br>$N = \frac{m}{M}$ | Simplest Mole Ratio<br>(÷ smallest n) |
|---------|----------|----------------------|--------------------------------------|---------------------------------------|
| C       | 1.0105   | 12.01                | $\frac{1.0105}{12.01} = 0.08414$     | $\frac{0.08414}{0.08399} = 1$         |
| H       | 0.1697   | 1.01                 | $\frac{0.1697}{1.01} = 0.1680$       | $\frac{0.1709}{0.08399} = 2$          |
| O       | 1.3438   | 16.00                | $\frac{1.3438}{16.00} = 0.08399$     | $\frac{0.08399}{0.08399} = 1$         |

∴ Empirical formula of the compound containing carbon, hydrogen and oxygen is CH<sub>2</sub>O

b) Molecular formula  $6 \times \text{CH}_2\text{O} = \text{C}_6\text{H}_{12}\text{O}_6$

#### Chapter Review p. 229

1. This simplifies calculations, as the molar masses of the compound, and that of the elements can be used to calculate percentage composition data.

2. It is exactly the same as water found in nature, as all water has the same formula, H<sub>2</sub>O, regardless of how it was created in the first place.

3. a) Masses of CO<sub>2</sub> and H<sub>2</sub>O generated during the combustion, as well as the mass of the original hydrocarbon burned.

b) Their results would be the same, and the C-H combustion analyzer provides data that can be used to calculate an empirical formula, not a molecular formula. Additional information obtained through other means is needed to calculate a molecular formula.

4. No, there is not enough information to get an empirical formula in the first place, as the mole ratios of the elements must be known.

5.  $M(\text{Na}_2\text{B}_4\text{O}_7) \cdot 10\text{H}_2\text{O} = 381.42 \text{ g/mol}$

$n((\text{Na}_2\text{B}_4\text{O}_7) \cdot 10\text{H}_2\text{O}) = 5.00 \text{ g} \div 381.42 \text{ g/mol} = 0.0131 \text{ mol borax } (\text{Na}_2\text{B}_4\text{O}_7) \cdot 10\text{H}_2\text{O}$

therefore  $n(\text{H}_2\text{O}) = 10 \times 0.0131 \text{ mol} = 0.131 \text{ mol}$

$m(\text{H}_2\text{O}) = 0.131 \text{ mol} \times 18.02 \text{ g/mol} = 2.36 \text{ g}$

therefore mass of borax remained after water was removed:

$m(\text{Na}_2\text{B}_4\text{O}_7) = 5.00 \text{ g} - 2.36 \text{ g} = 2.64 \text{ g}$

6. a)  $M(\text{CCl}_2\text{F}_2) = 120.91 \text{ g/mol}$

%cm (C) =  $12.01 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 9.93\%$

%cm (Cl) =  $2 \times 35.45 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 58.6\%$

%cm (F) =  $2 \times 19.00 \text{ g/mol} \div 120.91 \text{ g/mol} \times 100\% = 31.4\%$

b)  $M[\text{Pb}_3(\text{OH})_2(\text{CO}_3)_2] = 776.15 \text{ g/mol}$

%cm (Pb) =  $3 \times 207.37 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 80.2\%$

%cm (O) =  $8 \times 16.00 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 16.5\%$

%cm (H) =  $2 \times 1.01 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 0.260\%$

%cm (C) =  $2 \times 12.01 \text{ g/mol} \div 776.15 \text{ g/mol} \times 100\% = 3.09\%$

7. a)  $M(\text{MgCl}_2\text{C}_2\text{H}_2\text{O}) = 131.25 \text{ g/mol}$

$n(\text{MgCl}_2\text{C}_2\text{H}_2\text{O}) = 25.00 \text{ g} \div 131.25 \text{ g/mol} = 0.1905 \text{ mol}$

$n(\text{H}_2\text{O}) = 2 \times 0.1905 \text{ mol} = 0.3810 \text{ mol}$

$m(\text{H}_2\text{O}) = 0.3810 \text{ mol} \times 18.02 \text{ g/mol} = 6.866 \text{ g}$

b)  $M(\text{KMnO}_4) = 158.04 \text{ g/mol}$

$\% \text{cm (Mn)} = 54.94 \text{ g/mol} \div 158.04 \text{ g/mol} \times 100\% = 34.76\%$

$m(\text{Mn}) = 34.76\% \times 5.00 \text{ g} = 1.74 \text{ g}$

8. a)  $M(\text{AgNO}_3) = 169.88 \text{ g/mol}$

$\% \text{cm (Ag)} = 107.87 \text{ g/mol} \div 169.88 \text{ g/mol} \times 100\% = 63.50\%$

b)  $m(\text{Ag}) = 63.50\% \times 2.00 \times 102 \text{ kg} = 127 \text{ kg}$

9.  $M(\text{BaSO}_4) = 233.40 \text{ g/mol}$

$\% \text{cm (Ba)} = 137.33 \text{ g/mol} \div 233.40 \text{ g/mol} \times 100\% = 58.84\%$

$m(\text{Ba}) = 58.84\% \times 45.8 \text{ g} = 26.9 \text{ g}$

10.  $M[\text{Bi}(\text{NO}_3)_2] = 333.00 \text{ g/mol}$

$\% \text{cm (Bi)} = 208.98 \text{ g/mol} \div 333.00 \text{ g/mol} \times 100\% = 62.76\%$

$m(\text{Bi}) = 62.76\% \times 268 \text{ g} = 168 \text{ g}$

11.  $M(\text{Empirical}) = 30.03 \text{ g/mol}$

$M(\text{Molecular}) \div M(\text{Empirical}) = 121 \text{ g/mol} \div 30.03 \text{ g/mol} = 4$

Therefore, molecular formula is  $4(\text{CH}_2\text{O}) = \text{C}_4\text{H}_8\text{O}_4$

12.  $M(\text{C}_6\text{H}_2\text{OCl}_2) = 160.98 \text{ g/mol}$

$M(\text{Molecular}) \div M(\text{Empirical}) = 322 \text{ g/mol} \div 160.98 \text{ g/mol} = 2$

Therefore, molecular formula is  $2(\text{C}_6\text{H}_2\text{OCl}_2) = \text{C}_{12}\text{H}_4\text{O}_2\text{Cl}_4$

13. a) A formula cannot have a fractional subscript, as this implies fractional atoms in a formula.

b) empirical formula =  $3(\text{CH}_{2.67}) = \text{C}_3\text{H}_8$

14.

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| C       | 80.2     | 12.01    | 6.67   | 10.5       | 21                          |
| H       | 9.62     | 1.01     | 9.54   | 15         | 30                          |
| O       | 10.18    | 16.00    | 0.636  | 1          | 2                           |

Therefore empirical formula is  $\text{C}_{21}\text{H}_{30}\text{O}_2$

15.

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| Na      | 17.6     | 22.99    | 0.766  | 1          | 2                           |
| Cr      | 39.7     | 52.00    | 0.763  | 1          | 2                           |
| O       | 42.8     | 16.00    | 2.67   | 3.5        | 7                           |

Therefore empirical formula is  $\text{Na}_2\text{Cr}_2\text{O}_7$

16.

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| Hg      | 67.6     | 200.59   | 0.337  | 1          | 1                           |
| S       | 10.8     | 32.07    | 0.337  | 1          | 1                           |
| O       | 21.6     | 16.00    | 2.00   | 4          | 4                           |

Therefore empirical formula is  $\text{HgSO}_4$

17. a)

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| Ca      | 38.8     | 40.08    | 0.968  | 1.5        | 3                           |
| P       | 20.0     | 30.97    | 0.646  | 1          | 2                           |
| O       | 41.2     | 16.00    | 2.575  | 4          | 8                           |

b) Since each formula unit as 2 P, and so does the empirical formula, the molecular formula is most likely the same. It is more recognizable as  $\text{Ca}_3(\text{PO}_4)_2$ .

18. a)

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| C       | 71.0     | 12.01    | 5.91   | 18         | 18                          |
| H       | 8.60     | 1.01     | 8.51   | 26         | 26                          |
| O       | 15.8     | 16.00    | 0.988  | 3          | 3                           |
| N       | 4.60     | 14.01    | 0.328  | 1          | 1                           |

Therefore, the empirical formula of Capsaicin is  $\text{C}_{18}\text{H}_{26}\text{O}_3\text{N}$

b) Since both the empirical and molecular formulas contain one N, the molecular formula is the same as the empirical formula  $\text{C}_{18}\text{H}_{26}\text{O}_3\text{N}$

19. Create a table as for empirical formula and work backwards to determine the molar mass of X, therefore identifying it.

| Element | Mass (%) | M(g/mol) | n(mol) | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|--------|------------|-----------------------------|
| X       | 56.00    | ??????   | 1.1    | 2          | 2                           |
| O       | 44.00    | 16.00    | 2.75   | 5          | 5                           |

Therefore,  $M = 56.00\text{g} \div 1.1\text{ mol} = 50.91\text{ g/mol}$

V, with a  $M=50.94\text{ g/mol}$ , is the closest. A formula of  $\text{V}_2\text{O}_5$  is a valid formula!

20.  $m(\text{H from HCl}) = 4.730\text{g} \times 1.01\text{g/mol} \div 36.46\text{ g/mol} = 0.131\text{ g}$   
 $m(\text{C from CCl}_4) = 9.977\text{g} \times 12.01\text{ g/mol} \div 153.81\text{ g/mol} = 0.7790\text{ g}$   
 $m(\text{O}) = 1.254\text{ g} - 0.131\text{ g} - 0.7790\text{ g} = 0.344\text{ g}$

| Element | Mass (g) | M(g/mol) | n(mol)  | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|---------|------------|-----------------------------|
| C       | 0.7790   | 12.01    | 0.06486 | 3          | 3                           |
| H       | 0.131    | 1.01     | 0.130   | 6          | 6                           |
| O       | 0.344    | 16.00    | 0.0215  | 1          | 1                           |

Therefore, the empirical formula is C<sub>3</sub>H<sub>6</sub>O

21.  $m(\text{FeSO}_4) = 1.52 \text{ g}$

$$n(\text{FeSO}_4) = 1.52 \text{ g} \div 151.92 \text{ g/mol} = 0.0100 \text{ mol}$$

$$m(\text{H}_2\text{O}) = 2.78 \text{ g} - 1.52 \text{ g} = 1.26 \text{ g}$$

$$n(\text{H}_2\text{O}) = 1.26 \text{ g} \div 18.02 \text{ g/mol} = 0.0699$$

$$\text{mole ratio} = 7:1$$

Therefore, there are 7 water molecules for every formula unit of iron(II) sulfate.

22. a)  $m(\text{C}) \text{ from } \text{CO}_2 = 0.6871 \text{ g} \times 12.01 \text{ g/mol} \div 44.01 \text{ g/mol} = 0.1875 \text{ g}$

$$m(\text{H}) \text{ from } \text{H}_2\text{O} = 0.1874 \text{ g} \times 2.02 \text{ g/mol} \div 18.02 \text{ g/mol} = 0.02101 \text{ g}$$

$$m(\text{O}) = 0.5000 \text{ g} - 0.1875 \text{ g} - 0.02101 \text{ g} = 0.2915 \text{ g}$$

$$\% \text{cm (C)} = 0.1875 \text{ g} / 0.5000 \text{ g} \times 100\% = 37.50\%$$

$$\% \text{cm (H)} = 0.02101 \text{ g} / 0.5000 \text{ g} \times 100\% = 4.202\%$$

$$\% \text{cm (O)} = 0.2915 \text{ g} / 0.5000 \text{ g} \times 100\% = 58.30\%$$

b)

| Element | Mass (g) | M(g/mol) | n(mol)  | mole ratio | mole ratio in whole numbers |
|---------|----------|----------|---------|------------|-----------------------------|
| C       | 0.1875   | 12.01    | 0.01561 | 1          | 6                           |
| H       | 0.02101  | 1.01     | 0.02081 | 1.33       | 8                           |
| O       | 0.2915   | 16.00    | 0.01822 | 1.167      | 7                           |

Therefore, empirical formula of citric acid is C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>

c)  $M(\text{empirical}) = 192.14 \text{ g/mol}$

$$M(\text{molecular}) = 192 \text{ g/mol}$$

Therefore, molecular formula of citric acid is C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>.

23.  $M(\text{methanol}) = 32.05 \text{ g/mol}$

$$\% \text{cm (C)} = 12.01 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 37.47\%$$

$$\% \text{cm (H)} = 4.04 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 12.61\%$$

$$\% \text{cm (O)} = 16.00 \text{ g/mol} \div 32.05 \text{ g/mol} \times 100\% = 49.92\%$$

$$m(\text{C}) \text{ in methanol} = 1.00 \text{ g} \times 37.47\% = 0.3747 \text{ g}$$

$$m(\text{H}) \text{ in methanol} = 1.00 \text{ g} \times 12.61\% = 0.1261 \text{ g}$$

therefore,

$$m(\text{CO}_2) = 0.3747 \text{ g} \times 44.01 \text{ g/mol} \div 12.01 \text{ g/mol} = 1.373 \text{ g}$$

$$m(\text{H}_2\text{O}) = 0.1261 \text{ g} \times 18.02 \text{ g/mol} \div 2.02 \text{ g/mol} = 1.125 \text{ g}$$
